

CLEAR GUARD The Ultimate in Paint Chip Protection

Some 40 years ago, 3M developed a clear Polyurethane film to protect helicopter blades from debris damage. Over the years the film has been refined to protect critical chip prone areas for the auto industry. You may have a sample on your vehicle by the rear door and wheel. In the early 1980's, the application of clear film to the front of vehicles was born by stretching clear film across the front of a car's hood and fenders, and then hand trimming out the desired protected area.

Fast forward to today where computer software opened the door to exact fit pre-cut patterns to some 50,000 vehicles.

Some dealers offer these "Clear Guards" to their customers at time of purchase. 3M's paint protection film is OEM-approved by the top auto manufacturers domestically and imported. Virtually any painted frontal surface, including rocker panels, door edges, roof tops and more, can be protected. It has been tested to withstand small gravel, sand, winters salt, cold, extreme heat, and bugs—and it's only 8mil thick. It is "clear armor" for the front of your vehicle.

This paint protection film is virtually invisible and undetectable from a few feet away. Clear Guards are a semi-permanent install and can be removed or replaced if accidentally damaged.

No longer do you have to bear chipped paint, or install an unsightly nose mask. A pre-cut pattern is ready to be installed on your vehicle to help retain your vehicle's value.

For further information about Paint Protection Film, contact one of these "3M certified" installers closest to you.
